

## Compugen Brings Industry-Leading Google Enterprise Search Solutions to Canadian Businesses

Richmond Hill, Ont. – September 14, 2006 – Compugen Inc., one of the largest Canadian-owned IT solution and service providers and PC systems integrators, is pleased to announce that it has entered into a business relationship with Google where it will resell Google enterprise search products and provide implementation and consulting services to bring advanced enterprise search solutions to Canadian businesses.

“Compugen is an ideal reseller partner for Google Enterprise,” said Michael Lock, Director of North American Sales for Google Enterprise. “They have a cross-country presence that will allow customers from all over Canada to more easily acquire and deploy Google's enterprise search technology.”

In the first of two agreements, Compugen has been selected by Google as a national reseller of the Google Search Appliance. Using the same technology that has earned Google leadership in the search engine market, these enterprise products provide a corporate internal search solution as simple and powerful as Google.com itself. Users can quickly and easily search across the vast amounts of data held by today's organizations, including intranets, document and content management systems, file servers, corporate desktops, and business applications such as ERP, CRM and Business Intelligence.

The Google Search Appliance, aimed at medium to large organizations, can index millions of documents, and includes advanced security features that ensure that users can only access authorized information. This product is available in several models, from a single, 2U rack-mounted version that can be licensed to search up to three million documents at a rate of up to 25 queries per second, to a clustered appliance that can access tens of millions of documents and includes automatic internal clustering and failover for built-in redundancy.

“As the first national enterprise reseller authorized to resell Google enterprise search products in Canada, we're pleased to be able to be proactive in bringing innovative products to our customers,” says Harry Zarek, Compugen's President and CEO. Zarek goes on to say that, “Today's organizations have amassed a wealth of information, and these products enable them to tap further into that information for even greater business benefit and competitive advantage.”

In a second, related agreement, Compugen will provide search-related services and consulting as part of the Google Enterprise Professional program. Under this program, which includes developers, consultants and independent software vendors that provide value-added services for Google enterprise products, Google-trained Compugen consultants will help customers build powerful business solutions based on Google search technologies. This includes using Google APIs (Application Programming Interfaces) to write custom connectors to feed additional data sources, including an external data system, into the Google Search Appliance for processing, indexing and serving; or using the Google search authorization SPI (Service Provider Interface) to integrate the Google Search Appliance with an access control system so that search results are filtered based on the user's access credentials.

“Google is excited to have Compugen as a partner in the Google Enterprise Professional program,” says Kevin Smith, Program Manager for Google Enterprise Professional. “We’re looking forward to bringing the power of Google search to new customers in Canada.”

“We’re already seeing tremendous interest on a number of fronts, including the legal, healthcare, manufacturing and public sectors, as well as from those involved in areas such as HR, marketing and technical documentation,” says Zarek.

Zarek concluded his remarks by adding that, “The Google relationship is consistent with Compugen’s strategy to bring to its customers new and compelling products and services that offer advanced capabilities and help them derive even greater business value from their investments in technology.”
